Part 2 Project Documentation

Pastimes Web Application Prototype

1. Introduction

This project aims at developing a working prototype of an online clothes retail store called Pastimes. The application provides the user with features like registration, login and ability to interact with a system which is capable of purchasing and selling clothes. The application also contains administrative features whereby the administrator approves the users and manages the product listing.

The application is built using PHP, MySQL, HTML5 and CSS programming languages. The development of the prototype takes place using the local installation of XAMPP.

2. System Overview

The Pastimes web application is designed to simulate a real-world e-commerce environment for second-hand clothing.

- The users register with their personal information on the platform.
- Registered users get saved in the database in “pending” status.
- The administrator will login to the platform and confirm the user.
- If confirmed, then the user is able to login.
- They are able to explore clothes, put them in the shopping basket, and work with the system.
- Administrator is able to add, delete and manage the clothing item.

3. Database Design

The system uses a MySQL database named ClothingStore.

3.1 tblUser

Stores user information.

Fields:

- id (Primary Key)
- name
- email

- password (hashed)
- status (pending/approved)

3.2 tblAdmin

Stores administrator login details.

Fields:

- id (Primary Key)
- email
- password (hashed)

3.3 tblClothes

Stores clothing items available in the store.

Fields:

- id (Primary Key)
- name
- price
- image

3.4 tblOrder

Stores order-related information.

4. System Functionality

4.1 User Registration

Users can register by entering:

- Name
- Email
- Password

All fields are required and validated using HTML5. The password is encrypted using MD5 hashing before being stored in the database. Newly registered users are assigned a “pending” status until verified by the administrator.

4.2 Login System

User can login using their email address and password.

- Hashed password is checked against hashed passwords stored in database.
- When password is incorrect, then the form will be sticky and error message will appear.
- If password is correct but unverified, then user cannot login.
- When the password is verified, a message will be displayed.

4.3 Administrator Login and Verification

The admin can:

- Browsing through all the registered users
- Authenticating users (changing the user’s status from ‘pending’ to ‘approved’)
- User management

4.4 Shopping Cart System

Users can:

- View available clothing items
- Add items to a cart
- Remove items from the cart
- View total price

4.7 Delivery Details

- Users can enter their delivery address, which is stored in the database and used for order processing

5. Technologies Used

The following technologies were used to develop the system:

- PHP (Server-side scripting)
- MySQL (Database management)
- HTML5 (Structure and validation)

- CSS (Styling and layout)
- XAMPP (Local server environment)
- phpMyAdmin (Database management interface)

6. File Structure

- Pastimes/
 - |
 - |— DBConn.php
 - |— createTable.php
 - |— loadClothingStore.php
 - |— login.php
 - |— register.php
 - |— adminPanel.php
 - |— cart.php
 - |— shop.php
 - |
 - |— css/
 - |— style.css
 - |
 - |— images/
 - |— product images
 - |
 - |— data/
 - |— userData.txt
 - |
 - |— documentation/
 - |— WEDE6021_Part2_GROUP7.docx

7. Conclusion

The Pastimes web application successfully demonstrates the development of a functional e-commerce prototype using PHP and MySQL. The system implements key features such as user authentication, admin verification, database integration, and product management.

The application meets the requirements outlined in the assignment and provides a solid foundation for further development into a fully functional online store.
